

thermal overload

Introducing the sleek and light Thermal Overload for the Elsafe 3-pin plug Cable Starter range. The new design is an easy fit for any power solution due to the small, concealable housing which comes in black or white.

Thermal Overloads are required for any 3-pin plug that has more than 2 GPO's attached and is available with the Elsafe range of power modules.

When installed, the Thermal Overload will shut down power if the GPO's draw more than the standard 10A of power through the 3-pin plug.

As of the 2nd April 2015, all new starter cables that require Thermal Overloads will be equipped with the new design.
